Dr. Burkhart Lehmann (Managing Director IBU)

# 2. Product

# 2.1 Product description

The declaration refers to 1 m<sup>2</sup> impregnated plasterboard with a surface weight of 10 kg/m2. **2.2** Application

Plasterboards are directly pasted to the subsurface as dry plaster, as panelling for wall and ceiling cladding, mounting walls and suspended ceilings made of wood or galvanised metal and for manufacturing prefabricated components such as those screwed or nailed in the prefabricated building industry.

Applications of plasterboards as metal stud systems with single or double panelling in dry interior construction are outlined in the Environmental System Declaration ESD-BVG-2013111-D (IBU ESD-BVG-2013111-D).

It can be used in buildings for public, private or commercial applications.

# **IMPREGNATED PLASTERBOARD**

#### Owner of the Declaration

Bundesverband der Gipsindustrie e.V. Kochstraße 6-7 10969 Berlin

# Declared product / Declared unit

Impregnated plasterboard in accordance with /DIN EN 520/ and /DIN 18180/

# 1m2 (10 kg)

# Scope:

The EPD applies for all member companies of the Bundesverband der Gipsindustrie e.V. in accordance with the current list of members on www.gips.de and for products manufactured in Germany. The LCA considers specific information supplied by the manufacturers and suppliers of components exclusively for the cradle-to-gate production stage. The holder of the Declaration is liable for the information and evidence on which it is based; liability by IBU with regard to manufacturer's information, LCA data and evidence is excluded. This document is translated from the German Environmental Product Declaration into English. It is based on the German original version EPD-BVG-20140077-IAG1-DE. The verifier has no influence on the quality of the translation. The owner of the declaration shall be liable for the underlying information and evidence; the IBU shall not be liable with respect to manufacturer information, life cycle assessment data and evidences.

# Verification

The CEN Norm /EN 15804/ serves as the core PCR							
Independent verification of the declaration according to /ISO 14025/							
	internally	x	externally				
WENDER							
DrIng. Wolfram Trinius (Independent verifier appointed by SVR)							

# 2.3 Technical Data

Technical information is available in the information supplied by the manufacturers. Due to continuous updating of technical standards or approvals, such information is not listed within the framework of the Environmental Product Declaration. Details on essential requirements can be taken from the CE mark and/or Declaration of Performance (Construction Products Regulation).

Up-to-date technical information can be requested from the following manufacturers: Danogips GmbH www.danogips.de Knauf Gips KG www.knauf.de Saint-Gobain Rigips GmbH www.rigips.de Siniat GmbH www.siniat.com

**2.4 Placing on the market / Application rules** Regulation (EU) No. 305/2011 dated 9 March 2011 applies for placing on the market within the European Union /EFTA. The products require a Declaration of Performance considering DIN EN 520:2009-12: Gypsum plasterboards – Definitions, requirements and test methods; German version EN 520:2004+A1:2009 and CE marking.

Use is governed by the respective national guidelines; /DIN 18180/ is the national application standard in Germany. DIN 18181 applies for processing the plasterboards.

As a general rule, DIN 4103-1 applies for non-loadbearing interior partition walls, DIN 4103-4 applies for wooden stud systems and DIN 18183-1 applies for metal stud systems; DIN 18168-1 and DIN 18168-2 must be observed for suspended ceilings and ceiling panelling.

#### 2.5 Delivery status

Plasterboards can be supplied in various formats considering various thicknesses and individual requirements.

**Impregnated plasterboards** (Type H in accordance with /DIN EN 520/) are plasterboards displaying reduced water absorption. They are classified as water absorption classes H1 - H3.

# 2.6 Base materials / Ancillary materials

Plasterboards are manufactured in a continuous process from stucco and additives for the gypsum core (incl. starch and foaming agent) as well as high-quality, multi-pressed cardboard on large conveyor systems. Special cardboard and gypsum additives, e.g. silicone or wax, are used for reducing water absorption.

They do not contain any substances > 0.1% by weight which are included in the "Candidate List of Substances of Very High Concern" /ECHA 2013/.

#### 2.7 Manufacture

The manufacturing process comprises the steps depicted in Figure 1.

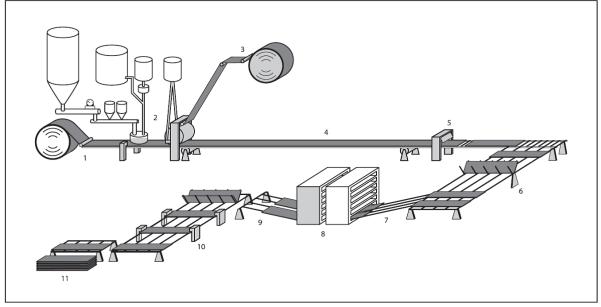

Fig. 1: Plasterboard manufacturing process in accordance with the /Gypsum Data Book/

- Cardboard is fed in facing downwards forming the visible side of the panel and incised to form the edges (1).

- Addition of gypsum slurry which is spread in the forming station as the cardboard is fed in from above (2-3).

- Setting section with shears for cutting (4-5)

- Turning table with input in a multi-level drier (6-8)- Panel discharge with trimming of transverse edges and bundling (9-11)

The manufacturing companies implemented a Quality Management System and are certified according to /DIN EN ISO 9001/.

# 2.8 Environment and health during manufacturing

Plasterboards are manufactured in plants permitted by emission laws in accordance with the specifications of the Federal Immission Control Act.

The plants implemented an Energy Management System in accordance with /DIN EN ISO 50001/. As of an aggregated rated thermal input of > 20 MW, gypsum plants are subordinated/subject to emissions trading.

# 2.9 Product processing/Installation

The products are processed in accordance with the relevant information leaflets issued by the Bundesverband der Gipsindustrie e.V. and the manufacturers.

During the cutting, sawing or grinding processes for gypsum products, the occupational exposure limit value of 6 mg/m3 alveolar dust (A-dust) must be

observed for calcium sulphate as a time-weighted average; in accordance with /TRGS 900/ "Occupational Exposure Limit Values" (issued in January 2006, last amended and supplemented by GMBI 2012, p. 11 [No. 1]).

If necessary, dust-reducing measures or organisational measures must be taken which are oriented towards the /TRGS 559/ "Mineral Dust" (issued in February 2010) and the exposure categories outlined therein.

# 2.10 Packaging

Plasterboards are stored on pallets and delivered without packaging. The wooden pallets used are available as reusable or disposable pallets.

### 2.11 Condition of use

The useful life of the plasterboards for interior applications reviewed here generally complies with the overall useful life of the building.

They are not subject to any exterior exposure.

# 2.12 Environment and health during use

During the use phase, no hazardous substances are emitted which exceed the limit values of the /AgBB/ test scheme. Plasterboards are tested by the Institut für Bauphysik /Scherer 2010/.

The test result indicates that the plasterboards are not associated with any adverse effects on the interior.

#### 2.13 Reference service life

Reference Service Lives depend on the respective applications.

In accordance with the BBSR "Useful lives of components for LCAs in accordance with the Sustainable Building assessment system" of the BBSR, last revised 03.11.2011, this is 50 years for walls as per code number 342.411 "Non-supporting interior partitions – Stud systems" (BBSR RSL). There are no influences on ageing when the recognised rules of technology are applied.

#### 2.14 Extraordinary effects

#### Fire

Plasterboards offer outstanding fire protection with regard to their low density. This is due to the fact that the gypsum core contains approx. 20% water of crystallisation which evaporates when exposed to fire thereby consuming energy by means of conversion. The temperature on the side facing away from the fire remains constant at approx. 110 °C over a longer period of time depending on the board thickness. The resulting dehydrated gypsum layer offers increased thermal insulation.

In accordance with Annex B of /DIN EN 520/, plasterboards are usually classified as A2-s1, d0 in terms of their fire performance. This classification to /DIN EN 13501-1/ means: A2 = non-flammable, s1 = no smoke, d0 = no flaming droplets/particles.

#### Water

Unless expressly designated by the manufacturer, all gypsum products must be protected from permanent humidity.

A leaflet is available from the Bundesverband der Gipsindustrie e.V. on removing damage caused by flooding to components made of gypsum /Flooding Leaflet/.

In the case of reduced water absorption, a distinction is made between the water absorption classes in accordance with the following table as per /DIN EN 520/:

Water absorption class	Surface water absorption (g/m <sup>2</sup> )	Total water absorption (%)
H1	180	≤ 5
H2	220	≤ 10
H3	300	≤ 25

#### **Mechanical destruction**

As a general rule, mechanical damage can be offset using jointing compound due to the ease of repair associated with the plasterboards and without any adverse effects on function.

Plasterboards can easily be replaced with new boards in the event of more extensive damage. No environmental consequences are to be anticipated in the event of unforeseen mechanical destruction.

#### 2.15 Re-use phase

#### Re-use

The plasterboards can not be re-used for the same application without undergoing some change. For the remaining re-uses/disposals, segregation of building materials on the building site is recommended.

#### Further use

Plasterboards which are as good as new (e.g. cuttings) can be used after crushing and possibly separating the cardboard and coatings in agreement with the customer as recultivation material in mining areas, for recovery on landfills, as soil conditioner, fertiliser components or acceleration agent for cement taking consideration of any official specifications.

#### Recycling

After treatment in special recycling plants for gypsum waste, recycled gypsum can be added to the manufacturing process for new boards following crushing and separation from the cardboard. Alternatively, the recycled gypsum can be used in the areas outlined for further use.

These recycling plants for gypsum waste also ensure that any screws or nails are removed by a magnetic separator.

Cardboard removed in these plants can be used as a secondary fuel or added to paper recycling; separated metals are recycled as scrap.

#### 2.16 Disposal

Disposal in accordance with the waste code:

17 08 02 Gypsum-based construction materials other than those mentioned in 17 08 01

Gypsum-based construction materials adhere to the disposal conditions from landfill class 1 of the Landfill Ordinance in the case of landfilling.

2.17 Further information www.gips.de

# 3. LCA: Calculation rules

# 3.1 Declared Unit

#### **Declared Unit**

Name	Value	Unit
Declared unit	1	m²
Conversion factor to 1 kg	0.1	-

#### 3.2 System boundary

The EPD refers to the production phase in accordance with /DIN EN 15804/, i.e. it comprises the manufacturing steps from the cradle to the factory gate.

Modules A1-A3 include the production of raw materials and transport thereof, the provision of energy and the manufacturing processes required for the production of all components for the plasterboard product.

#### 3.3 Estimates and assumptions

Assumptions regarding transport were made for all materials required and for disposal.

#### 3.4 Cut-off criteria

All components for manufacturing the plasterboards as well as all electricity and water required were taken into consideration.

Accordingly, material and energy flows with a share of less than 1 per cent were also considered.

It can be assumed that the processes neglected would have contributed less than 5% to the impact categories under review.

#### 3.5 Background data

The "GaBi 5" software system for comprehensive analysis developed by PE INERNATIONAL AG was used for modelling the production of all components /GaBi 5 2012/.

The Life Cycle Assessment was modelled for Germany as a reference area. Consequently, apart from the production processes under these framework conditions, the upstream stages of relevance for Germany such as the provision of electricity or energy were also used. The electricity mix for Germany 2008 is used.

# 3.6 Data quality

All background data sets of relevance were taken from the GaBi 5 software data base.

### 3.7 Period under review

The data used by PE INTERNATIONAL AG complies with the current level of knowledge at the time of modelling the LCA in early 2013.

#### 3.8 Allocation

Allocations were used in the background data for modelling the requisite components, e.g. for the provision of electricity. An allocation was avoided for the provision of FGD gypsum which is sometimes used for the production of calcium sulphate beta hemihydrate

#### 3.9 Comparability

Basically, a comparison or an evaluation of EPD data is only possible if all the data sets to be compared were created according to /EN 15804/ and the building context, respectively the product-specific characteristics of performance, are taken into account.

# 4. LCA: Scenarios and additional technical information

Technical information on the application forms the basis for developing specific scenarios within the context of a building evaluation.

Such scenarios for plasterboards are already available, e.g. for single- or double-layer metal stud frames with plasterboards (IBU ESD-BVG-2013111-D).

On account of the great number of possible applications, no scenarios are developed within the framework of this cradle-to-gate declaration; instead, reference is made to the Environmental System Declarations available on plasterboards.

# 6. LCA: Interpretation

In calculating the LCA, a generic national raw material mix for gypsum is applied for the upstream chain in order to comply with the various levels of availability in the individual plants and the interchangeability and/or combination possibilities offered by raw gypsum. Gypsum can be procured as a raw material from nature or as a by-product from desulphurisation of coal-fired power stations (FGD gypsum). While all material and energy flows are considered for natural gypsum, the cut-off limit for FGD gypsum is represented by the expenses associated with the manufacture of FGD gypsum following desulphurisation (e.g. electricity consumption by the belt filter but not the use of limestone in the flue gas scrubber or the disposal of FGD waste water). Delivery to the gypsum plant is initially followed by the manufacture of calcium sulphate beta hemi-hydrate

(stucco) through combustion of the raw gypsum (calcination) below 180 °C. This stucco is then combined with water and additives and applied between the cardboard sheets. This process is followed by thermal removal of the excess moisture in a drier.

Production significantly dominates the LCA impact categories due to the calcination of the raw gypsum associated with the consumption of fossil energy sources and drying the boards; these two sub-processes are responsible for approximately 60% of the GWP.

Impregnation results in a GWP increased by 4% and an ODP increased by 70% compared with boards which do not display these features. There is no scarcity of the resources used, i.e.

gypsum, cardboard made from waste paper and the additives used depending on the board type. Almost 90% of the ADPE is dominated by the use of natural gypsum for which the sulphur content of the

# 7. Requisite evidence

**7.1 Leaching** (sulphate + heavy metals) On analysis according to the Landfilling Ordinance, the product displays the sulphate concentration in the saturation range which is typical for gypsum (approx. 1500 mg/l), resulting in disposal options only from landfill class I upwards.

Gypsum is classified as a listed substance in Water Hazard Class 1 (slightly hazardous for water). Heavy metal content is significantly below the corresponding criteria for landfill class I.

Proper disposal in accordance with the parameters which can depend on use, sorting depth during deconstruction, collection (separately or together with other construction waste) and treatment, and must be determined by the waste producer responsible.

# 7.2 Radioactivity

The product can be used without restriction with overall dose contributions of significantly lower than 0.3 mSv/a, determined on the basis of the index calculation to RP 112 and the radon concentration (BfS report).

earth's crust is applied as a criterion for calculating the

Sb equivalent. As the LCA has been modelled from the

cradle to the factory gate, no credits are considered for

possible recycling of gypsum at the end of life.

# 7.3 VOC emissions

Total VOC incl. LCl R = Σ Ci/LCli < 1

The requirements in accordance with the AgBB test scheme, version 2008, are satisfied with regard to all existing test items /Scherer 2010/: **TVOC 3**  $\leq$  10 mg/m3 **Carcinogens 3 EU cat. 1 and 2**  $\leq$  0.01 mg/m3 **TVOC 28** < 1.0 mg/m3 **SVOC28**  $\leq$  0.1 mg/m3 **Carcinogens 28 EU cat. 1 and 2**  $\leq$  0.001 mg/m3 **Total VOC 28 excl. LCI**  $\leq$  0.1 mg/m3
